

The problem Unless the neutrality of the water in your central heating system has been maintained at its neutral point, corrosion will occur which can reduce your radiator efficiency by 5 – 7% and the life of your central heating system

The solution Addition of suitable low cost chemical inhibitors/descalers whenever your heating system is serviced
These can –

- limit corrosion and gas build up in radiators
- dissolve scale minerals plated on the inside of your radiators

This will result in warmer homes, lower heating bills, lengthening the life of your heating system and should enable your system to be converted to low carbon heating at some future time without having to replace the radiators.

Obtaining your voucher

Vexo is prepared to supply chemical inhibitor/descaler as free issue for up to 3 years as their contribution to limiting climate change. The only requirement is that your plumber/heating engineer makes some simple measurements whenever he services your boiler. There are a limited number of vouchers so do not delay and apply to day. To obtain your voucher, email voucher@vexoint.com

Further information

Leaflets on these measures and other relevant information is available at www.readingcan.org.uk

Restoring radiator efficiency

There are chemical processes available for restoring the efficiency of your radiators and reducing your heating bill.

If this treatment is not undertaken whenever your heating system is serviced then it is likely that -

- some areas of your radiators will not be hot requiring your radiators to be bled;
- your boiler may cut out between annual servicing;
- your heating bill will be higher than it should be.
